

The development of Gerontechnology is the key to surviving the future super-aging society. This is because the number of young people who support the elderly will inevitably decrease, and it is expected that the standard of living demanded by the elderly will increase in the future. In anticipation of such things, the development of technologies and systems to support the elderly has been very enthusiastic in recent years. In this symposium, we would like to introduce a number of such technologies and discuss their future plans. The symposium brought together specialists in nursing care, swallowing rehabilitation, online exercise therapy, and comprehensive geriatric assessment. It is expected that the symposium will be fruitful.
